

1] A bright image has a histogram that is skewed together towards Higher Intensity values

Most pixels are concentrated on right side of histogram.

Few pixel values show lower Intensity i.e darker values.

2] Dynamic range of a digital image is the difference between maximum and minimum Intensity values of an image.

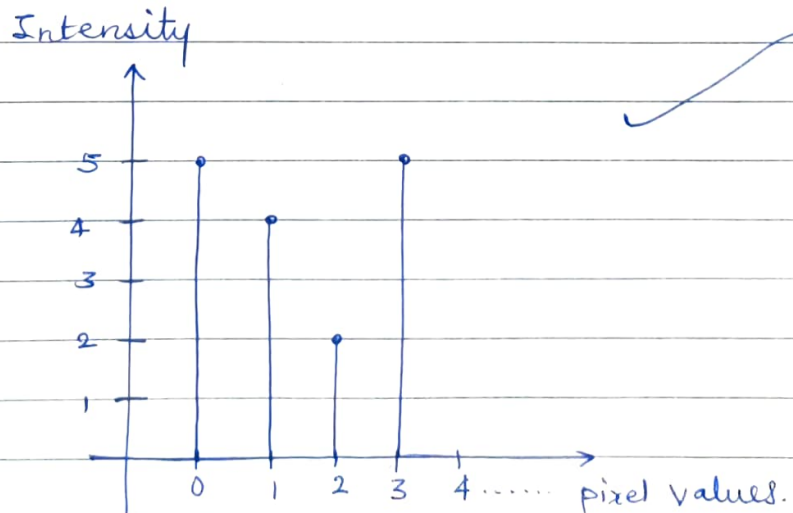

$$DR = I_{max} - I_{min}$$

Contrast measures how the Intensity values are spread across the range of Intensity values the image can exhibit.

A High contrast image is an image with large Intensity variations and the histogram more spread out.
